CMC	INTO	JNAE	JP	LOOPNZ	PUSHA	SAR	XLATB
CMP	IRET	JNB	JPE	LOOPZ	PUSHF	SBB	XOR
	JA				RCL		

Operand types:

REG: AX, BX, CX, DX, AH, AL, BL, BH, CH, CL, DH, DL, DI, SI, BP, SP.

SREG: DS, ES, SS, and only as second operand: CS.

memory: [BX], [BX+SI+7], variable, etc...(see [Memory Access](#)).

immediate: 5, -24, 3Fh, 10001101b, etc...

Notes:

- When two operands are required for an instruction they are separated by comma. For example:

REG, memory

- When there are two operands, both operands must have the same size (except shift and rotate instructions). For example:

AL, DL
DX, AX
m1 DB ?
AL, m1

m2 DW ?

AX, m2

- Some instructions allow several operand combinations. For example:

memory, immediate

REG, immediate

memory, REG

REG, SREG

- Some examples contain macros, so it is advisable to use **Shift + F8** hot key to *Step Over* (to make macro code execute at maximum speed set **step delay** to zero), otherwise emulator will step through each instruction of a macro. Here is an example that uses PRINTN macro:

-
-
- include 'emu8086.inc'
- ORG 100h
- MOV AL, 1
- MOV BL, 2
- PRINTN 'Hello World!' ; macro.
- MOV CL, 3
- PRINTN 'Welcome!' ; macro.
- RET

These marks are used to show the state of the flags:

1 - instruction sets this flag to **1**.

0 - instruction sets this flag to **0**.

r - flag value depends on result of the instruction.

? - flag value is undefined (maybe **1** or **0**).

Some instructions generate exactly the same machine code, so disassembler may have a problem decoding to your original code. This is especially important for Conditional Jump instructions (see "[Program Flow Control](#)" in Tutorials for more

information).

Instructions in alphabetical order:

Instruction	Operands	Description												
AAA	No operands	<p>ASCII Adjust after Addition. Corrects result in AH and AL after addition when working with BCD values.</p> <p>It works according to the following Algorithm:</p> <p>if low nibble of AL > 9 or AF = 1 then:</p> <ul style="list-style-type: none">• AL = AL + 6• AH = AH + 1• AF = 1• CF = 1 <p>else</p> <ul style="list-style-type: none">• AF = 0• CF = 0 <p>in both cases: clear the high nibble of AL.</p> <p>Example: MOV AX, 15 ; AH = 00, AL = 0Fh AAA ; AH = 01, AL = 05 RET</p> <table><tr><td>C</td><td>Z</td><td>S</td><td>O</td><td>P</td><td>A</td></tr><tr><td>r</td><td>?</td><td>?</td><td>?</td><td>?</td><td>r</td></tr></table>	C	Z	S	O	P	A	r	?	?	?	?	r
